

Mastering Strings in Java: Everything You Need to Know!

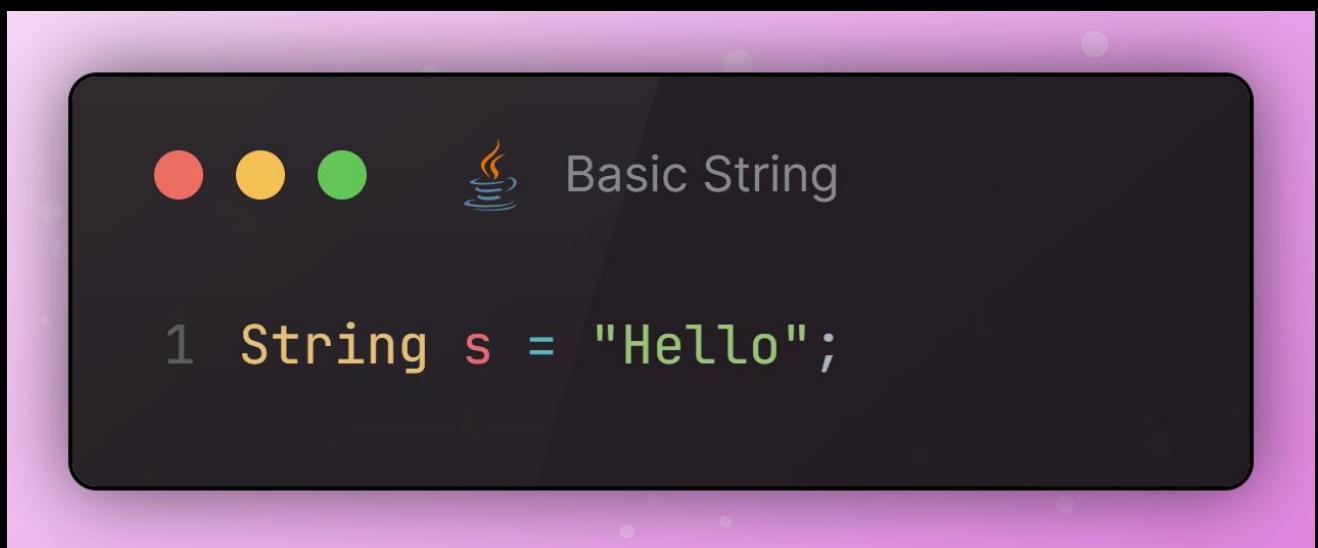

- From basics to best practices – let's unravel Java Strings.

1

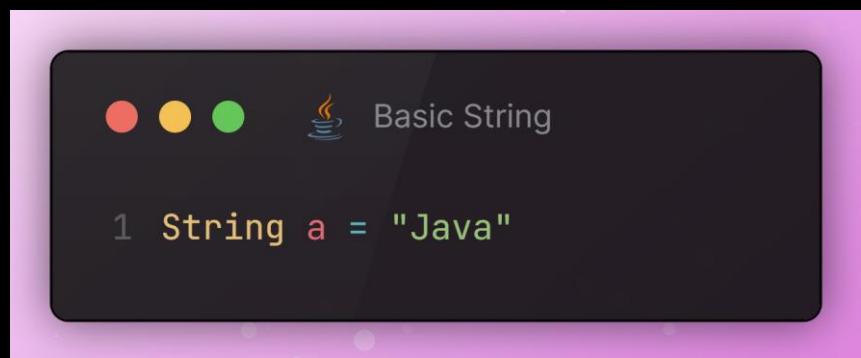

What is a String in Java?

- 👉 String is a class in Java, not a primitive type.
- 👉 Immutable → Once created, it cannot be changed.
- 👉 Stored in the String Pool (special memory region).

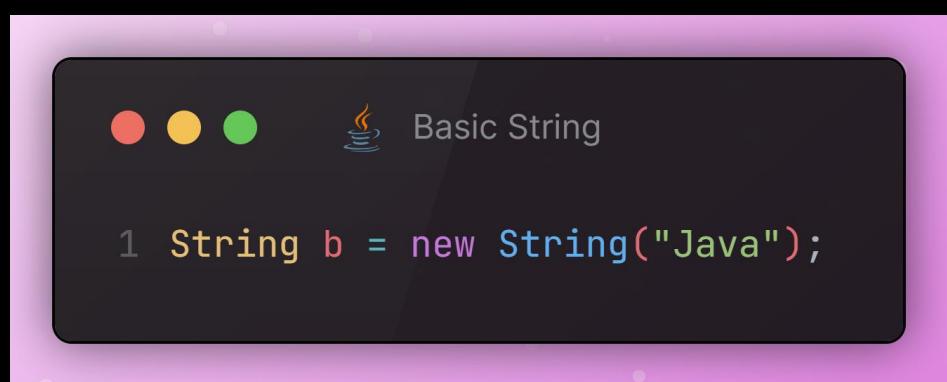

2 String Creation: Two Ways

💡 Literal way (stored in string pool):

💡 Using new keyword (stored in heap):

💡 *String pool helps save memory and improve performance.*

3 Why are Strings

Immutable?

👉 **Security** – Prevents unintended modifications (e.g., database connections, file paths).

👉 **Thread Safety** – Can be shared across threads without synchronization.

👉 **Thread Performance** – Enables String Pool optimization.

4 String Methods You MUST Know!

```
Basic String

1 public class StringOperations {
2     public static void main(String[] args) {
3
4         // checks if a string is empty
5         System.out.println("").isEmpty(); // true
6         // returns the length
7         System.out.println("Java".length()); // 4
8         // returns the character based on index
9         System.out.println("Java".charAt(0)); // J
10        // starts at the first index and prints the rest
11        System.out.println("Java".substring(1)); // ava
12        // starts at the first index and excludes the last index
13        System.out.println("Java".substring(1, 3)); // av
14        // Join the two or more strings
15        System.out.println("Java".concat(" Program")); // Java Program
16        // Compares the two strings strict comparision
17        System.out.println("Java".equals("java")); // false
18        // Compares the two strings loose comparision
19        System.out.println("Java".equalsIgnoreCase("java")); // True
20        // Converts the string to lower case
21        System.out.println("Java".toLowerCase()); // java
22        // Converts the string to UPPER CASE
23        System.out.println("Java".toUpperCase()); // JAVA
24        // Trims out the spaces around the string
25        System.out.println(" Java ".trim()); // Java
26        // Replaces every occurence of old with new character
27        System.out.println("Java".replace('a', 'o')); // Jovo
28        // Splits the java string into array of substrings
29        String[] myArray = "Java".split("");
30        for (String s : myArray) {
31            System.out.println(s); // J a v a
32        }
33    }
34 }
35 }
```

👉 Practice these! They're used in real interviews.

5 String Comparison

`==` vs `.equals()`

The screenshot shows a Java code editor with a dark theme. At the top left are three colored circles (red, yellow, green). At the top right is a coffee cup icon followed by the text "Basic String". The code in the editor is:

```
1 String a = "Java";
2 String b = new String("Java");
3
4 a == b          // false (reference)
5 a.equals(b)    // true (value)
6
```

String vs StringBuilder vs StringBuffer

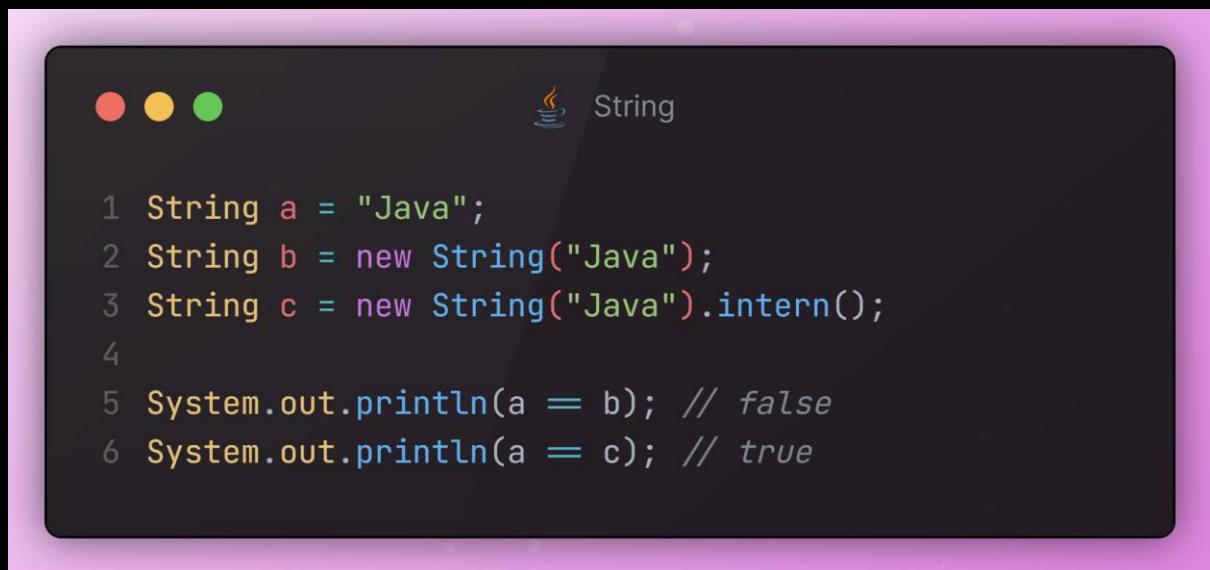

| Feature | String | StringBuilder | StringBuffer |
|----------------------|------------------------|-------------------------------|------------------------------------|
| Mutability | Immutable | Mutable | Mutable |
| Thread Safety | Yes(Immutable) | No | Yes(Synchronized) |
| Performance | Slow for modifications | Fast | Slightly slower than StringBuilder |
| When to use | Fixed Values | Single-threaded Modifications | Multi-threaded Modifications |

String

```
1 // StringBuilder (Faster, not thread-safe)
2 StringBuilder sb = new StringBuilder("Hello");
3 sb.append(" World");
4 System.out.println(sb); // "Hello World"
5
6 // StringBuffer (Thread-safe)
7 StringBuffer sBuffer = new StringBuffer("Hello");
8 sBuffer.append(" World");
9 System.out.println(sBuffer); // "Hello World"
```

7 String Interning

The screenshot shows a dark-themed macOS terminal window. The title bar says "String". The terminal contains the following Java code:

```
1 String a = "Java";
2 String b = new String("Java");
3 String c = new String("Java").intern();
4
5 System.out.println(a == b); // false
6 System.out.println(a == c); // true
```

💡 *intern() ensures string is added to pool.*

 Best Practices

- Use `.equals()` for string comparison
- Prefer `StringBuilder` for string manipulation in loops
- Avoid using `==` unless comparing references
- Use `.intern()` only when needed
- Beware of memory leaks from unused interned strings

 And that's a Wrap-Up
